

 Did You Know?

Artificial Intelligence (AI) is a branch of Computer Science that enables machines to perform tasks that normally require human intelligence.

What is Artificial Intelligence?

Artificial Intelligence (AI) is the ability of machines or computer systems to think, learn, solve problems and make decisions like humans. AI helps computers perform intelligent tasks automatically.

Why do we use AI?

- Automate repetitive tasks
- Improve decision making
- Reduce human effort
- Increase accuracy
- Solve complex problems

History of AI

Year	Event
1950	Alan Turing introduced the Turing Test.
1956	The term "Artificial Intelligence" was introduced by John McCarthy.
1997	IBM Deep Blue defeated World Chess Champion Garry Kasparov.
Today	AI is widely used in healthcare, education, banking and transportation.

Simple AI Example

User → AI System → Decision → Output

Example:

Voice Command

↓

Virtual Assistant

↓

Answer

Applications of AI

- Healthcare
- Education
- Banking
- Self-driving Cars
- Robotics

- Cyber Security
- E-commerce
- Virtual Assistants

Advantages of AI

- Works 24/7
- Fast processing
- Reduces human errors
- Improves productivity
- Automates difficult tasks

Disadvantages of AI

- High development cost
- Job replacement

- Lack of emotions
- Depends on data quality
- Privacy concerns

Interview Questions

Q1: What is Artificial Intelligence?

Artificial Intelligence is the ability of machines to perform tasks that normally require human intelligence.

Q2: Who is known as the Father of AI?

John McCarthy.

Q3: Name two applications of AI.

Healthcare and Banking.
