

## Did You Know?

CSS Selectors are the foundation of CSS because they allow developers to choose exactly which HTML elements should be styled.

## What are CSS Selectors?

CSS Selectors are patterns used to select HTML elements. They tell the browser which elements should receive CSS styles.

## Why do we use CSS Selectors?

- Select specific HTML elements
- Apply styles to webpages
- Create organized CSS code
- Reduce repeated styling
- Improve website design

## Types of CSS Selectors

| Selector                | Description                            |
|-------------------------|----------------------------------------|
| Universal Selector (*)  | Selects all HTML elements              |
| Element Selector        | Selects elements using tag name        |
| Class Selector (.class) | Selects elements with a specific class |
| ID Selector (#id)       | Selects one unique element             |
| Group Selector          | Selects multiple elements together     |

# CSS Selector Syntax

The basic syntax of a CSS Selector is:

```
selector{  
  property:value;  
}
```

## Examples of CSS Selectors

### 1. Universal Selector

```
*{  
  margin:0;  
  padding:0;  
}
```

This applies styles to all HTML elements.

## 2. Element Selector

```
p{  
  color:blue;  
}
```

This changes the color of all paragraph elements.

## 3. Class Selector

```
.title{  
  color:red;  
}
```

Class selector is used with a dot (.) and can be applied to multiple elements.

## 4. ID Selector

```
#header{  
  background:black;
```

```
}
```

ID selector is used with # and targets one unique element.

## Common Mistakes

- Using # instead of . for class selector
- Using duplicate IDs
- Writing incorrect selector names
- Applying styles to wrong elements

## Real Life Uses

- Designing navigation menus
- Styling buttons
- Creating website layouts

- Changing text appearance
- Designing responsive websites

## Interview Questions
