

Did You Know?

CSS provides more than 140 predefined color names and also supports HEX, RGB, RGBA and HSL color formats.

What are CSS Colors?

CSS Colors are used to change the color of text, backgrounds, borders and other webpage elements. Colors make websites attractive and improve user experience.

Why do we use Colors & Backgrounds?

- Improve webpage appearance
- Highlight important content
- Create attractive designs
- Increase readability
- Build professional websites

Common Color Formats

Format	Example
Color Name	red
HEX	#ff0000
RGB	rgb(255,0,0)
RGBA	rgba(255,0,0,0.5)
HSL	hsl(0,100%,50%)

Background Properties

Property	Purpose
background-color	Sets background color
background-image	Adds background image
background-repeat	Controls image repeating
background-size	Controls image size
background-position	Sets image position

Example

```
body{  
  background-color:lightblue;  
}  
h1{  
  color:darkblue;
```

```
}  
  
div{  
background-color:yellow;  
}
```

Advantages

- Beautiful webpage design
- Easy customization
- Professional appearance
- Improves readability
- Better user experience

Common Mistakes

- Using too many bright colors
- Poor text and background contrast

- Wrong HEX values
- Large background images
