

Did You Know?

The CSS display property controls how an element appears on a webpage, while the position property controls where it appears.

What is Display in CSS?

The display property defines how an HTML element is displayed on the webpage. Different display values help create different webpage layouts.

Common Display Values

Display Value	Description
block	Takes full width of the page

inline	Takes only required width
inline-block	Inline element with block features
none	Hides the element
flex	Creates flexible layouts
grid	Creates grid layouts

What is Position in CSS?

The position property controls the location of an HTML element on a webpage.

Types of Position

Position	Description
static	Default position
relative	Moves relative to its original position
absolute	Moves relative to its parent element
fixed	Stays fixed while scrolling

sticky

Acts like relative then fixed

Example

```
.box{  
display:block;  
position:relative;  
top:20px;  
left:30px;  
}
```

Advantages

- Creates professional layouts
- Easy element positioning
- Improves webpage design
- Responsive layouts
- Better user experience

Common Mistakes

- Using absolute without parent position
- Confusing block and inline
- Overusing fixed position
- Ignoring z-index

Interview Questions

Q1: Which property controls element visibility?

display

Q2: Which display value hides an element?

display:none

Q3: Which position stays fixed while scrolling?

fixed
