

Did You Know?

Flexbox was introduced in CSS3 to make webpage layouts easier and more responsive without using floats.

What is Flexbox?

Flexbox (Flexible Box Layout) is a CSS layout model used to arrange items in rows or columns. It makes it easy to align, distribute and organize elements on a webpage.

Why do we use Flexbox?

- Create responsive layouts
- Align items easily
- Reduce CSS code
- Build modern websites
- Improve webpage design

Important Flexbox Properties

Property	Purpose
display:flex	Creates a flex container
flex-direction	Sets row or column layout
justify-content	Aligns items horizontally
align-items	Aligns items vertically
gap	Adds space between items
flex-wrap	Moves items to next line

Example

```
.container{  
  display:flex;  
  justify-content:center;  
  align-items:center;  
  gap:20px;  
}
```

Common Values

Property	Values
flex-direction	row, column
justify-content	center, space-between, space-around
align-items	center, flex-start, flex-end

Advantages

- Easy alignment
- Responsive design
- Less CSS code
- Professional layouts
- Works on all modern browsers

Common Mistakes

- Forgetting display:flex
- Confusing justify-content and align-items
- Not using flex-wrap when needed

- Applying Flexbox to the wrong element

Interview Questions
