

Did You Know?

Semantic HTML helps search engines and browsers understand the structure of a webpage. It also improves SEO and accessibility.

What is Semantic HTML?

Semantic HTML uses meaningful tags that clearly describe the purpose of the content. Instead of using only `<div>` tags, semantic tags explain what each section of the webpage represents.

Semantic vs Non-Semantic Tags

Semantic Tags	Non-Semantic Tags
<header>	<div>
<nav>	
<main>	<div>
<article>	
<section>	<div>
<footer>	<div>

Common Semantic Tags

Tag	Purpose
-----	---------

<code><header></code>	Top section of a webpage
<code><nav></code>	Navigation menu
<code><main></code>	Main webpage content
<code><section></code>	Groups related content
<code><article></code>	Independent article or blog
<code><aside></code>	Sidebar content
<code><footer></code>	Bottom section of webpage

Example

```
<header>
Website Header
</header>
<nav>
Home | About | Contact
</nav>
<main>
```

```
<section>
Welcome to my website.
</section>
</main>
<footer>
Copyright 2026
</footer>
```

Advantages of Semantic HTML

- Improves SEO
- Better Accessibility
- Easy to Read
- Professional Code Structure
- Easy Maintenance

Common Mistakes

- Using div everywhere
- Incorrect semantic tag placement
- Multiple main tags
- Using footer inside unrelated elements
