

JavaScript Chapter 2

Variables & Data Types

Learn JavaScript variables, let, const and different data types with easy examples.

Web Development

 Did You Know?

Variables are like containers that store information in JavaScript. They help programmers save and reuse data in their programs.

 What are Variables?

Variables are used to store data values in JavaScript. A variable has a name and a value that can be used throughout a program.

 Creating Variables in JavaScript

JavaScript provides three keywords to create variables:

- var
- let
- const

var Keyword

The var keyword is the old way of declaring variables in JavaScript. Its value can be changed and it has function scope.

```
var name = "Noor";  
var age = 20;
```

let Keyword

The `let` keyword is used to create variables whose values can be changed later. It has block scope.

```
let city = "Rawalpindi";  
city = "Lahore";
```

const Keyword

The `const` keyword is used for values that cannot be reassigned after creation.

```
const pi = 3.14;
```

Difference Between var, let and const

Keyword	Description
var	Old method, value can be changed
let	Modern method, value can be updated
const	Value cannot be reassigned

JavaScript Data Types

Data types define what type of value a variable stores.

Primitive Data Types

- String
- Number
- Boolean
- Undefined

- Null
- BigInt
- Symbol

Non-Primitive Data Types

- Object
- Array

Example of Data Types

```
let name = "Noor";  
let age = 20;  
let student = true;  
let marks = [90,85,95];
```

Common Mistakes

- Using variable without declaration
- Using const when value needs to change
- Writing incorrect variable names
- Confusing data types

Interview Questions

Q1: What is a variable in JavaScript?

A variable stores data values that can be used in a program.

Q2: Name three keywords used to declare variables.

var, let and const

Q3: Which keyword creates a constant variable?

const

Q4: What are JavaScript data types?

They define the type of value stored in a variable.

Quick Revision

var: Old variable keyword

let: Changeable value

const: Fixed value

Data Types: String, Number, Boolean, Object
