JavaScript Chapter 4

Functions

Learn JavaScript functions, parameters, return values and examples.

 Did You Know?

Functions help programmers write reusable code and avoid repeating the same instructions.

 What are Functions?

A function is a reusable block of code that performs a specific task. Functions help organize programs and make code easier to understand.

 Why do we use Functions?

- Reuse code multiple times

- Reduce code repetition
- Make programs organized
- Improve code readability

Creating a Function

```
function greet(){  
  console.log("Hello World");  
}
```

▶ Calling a Function

A function runs when we call its name.

```
greet();
```

Function Parameters

Parameters are values passed inside a function to perform operations.

```
function welcome(name){  
  console.log("Hello " + name);  
}  
welcome("Noor");
```

Return Statement

The return statement sends a value back from a function.

```
function add(a,b){  
  return a+b;  
}
```

Arrow Functions

Arrow functions are a shorter way to write functions introduced in ES6.

```
const add = (a,b) => {  
  return a+b;  
};
```

Common Mistakes

- Calling function before creating it
- Missing brackets
- Using wrong parameters
- Forgetting return statement

Interview Questions

Q1: What is a function?

A reusable block of code that performs a specific task.

Q2: Why are functions used?

To reuse code and make programs organized.

Q3: What are parameters?

Values passed to a function.

Q4: What is an arrow function?

A shorter syntax for writing functions.

Quick Revision

Function: Reusable Code Block

Parameter: Input Value

Return: Output Value

Arrow Function: ES6 Short Syntax
