

React Chapter 3

Components

Learn React Components, their types and how reusable UI is created using components.

[Home](#)[Web Development](#)

Did You Know?

Components are the building blocks of every React application. A complete webpage is made by combining multiple components.

What are React Components?

A Component is a reusable piece of code that returns part of the user interface (UI). Instead of writing the same HTML again and again, developers create components and reuse them.

Why do we use Components?

- Reuse code
- Reduce repetition
- Easy maintenance
- Organized project structure
- Faster development

Types of Components

Type	Description
Functional Component	Simple JavaScript function
Class Component	Uses ES6 classes (older method)

Functional Component Example

```
function Welcome(){  
  return  
  Hello Noor  
  ;  
}
```

Using a Component

```
function App(){  
  return ;  
}
```

Component Structure

Each component should have a single responsibility and return one parent element.

```
function Header(){  
  return(  

```

Noor Study Hub

```
);  
}
```

Advantages of Components

- Reusable code
- Cleaner projects
- Easy debugging

- Easy updates
- Professional structure

Common Mistakes

- Writing multiple parent elements
- Component name starting with lowercase letter
- Not returning JSX
- Using components without importing them

Interview Questions

Q1: What is a React Component?

A reusable block of UI.

Q2: What are the two types of Components?

Functional and Class Components.

Q3: Which component type is mostly used today?

Functional Components.

Q4: Why are Components important?

They make code reusable and organized.

Quick Revision

Component Reusable UI Block

Main Type Functional Component

Old Type Class Component

Benefit Reusable Code
