React Chapter 4

Props & State

Learn React Props and State, their differences and how data is managed in React components.

 Did You Know?

Props are used to pass data from one component to another, while State stores data that can change inside a component.

 What are Props?

Props (Properties) are used to pass data from a parent component to a child component. Props are read-only, which means they cannot be modified by the child component.

 Props Example

```
function Welcome(props){  
  return  
  Hello {props.name}  
  ;  
}
```

What is State?

State is used to store data inside a component. Unlike Props, State can change during program execution.

State Example

```
const [count, setCount] = useState(0);
```

Difference Between Props & State

Props	State
Passed from Parent	Managed inside Component
Read Only	Can Change
Cannot Modify	Can Update
Used for Communication	Used for Dynamic Data

Why do we use Props?

- Pass data
- Reuse components
- Keep code organized
- Improve communication between components

Why do we use State?

- Store changing values
- Update UI automatically
- Handle user interaction
- Manage application data

Advantages

- Reusable components
- Dynamic user interface
- Better data management
- Clean code structure
- Easy maintenance

Common Mistakes

- Trying to modify Props
- Using State without `useState()`
- Confusing Props with State
- Updating State directly

Interview Questions

Q1: What are Props?

Props are used to pass data between components.

Q2: What is State?

State stores data that can change inside a component.

Q3: Can Props be modified?

No.

Q4: Can State change?

Yes.

Quick Revision

Props Read Only

State Changeable Data

Props Source Parent Component

State Owner Current Component
