React Chapter 6

React Router

Learn React Router, navigation between pages and route management with simple examples.

Did You Know?

React Router allows users to move between different pages without reloading the entire website.

What is React Router?

React Router is a library used for navigation in React applications. It helps developers create multiple pages and switch between them without refreshing the browser.

Why do we use React Router?

- Create multiple pages
- Fast page navigation
- No full page reload
- Better user experience

- Professional web applications

Important Components

Component	Purpose
BrowserRouter	Wraps the application
Routes	Contains all routes
Route	Defines a page
Link	Navigates between pages

Basic Example

```
import {  
  BrowserRouter,  
  Routes,  
  Route  
} from "react-router-dom";
```

Route Example

```
} />
```

```
} />
```

Link Example

About

Advantages

- Fast navigation
- No page refresh
- Easy routing
- Improves user experience
- Professional applications

Common Mistakes

- Forgetting BrowserRouter
- Wrong route path
- Missing Link import
- Typing incorrect URL

Interview Questions

Q1: What is React Router?

A library used for navigation in React applications.

Q2: Which component wraps the application?

BrowserRouter

Q3: Which component creates navigation links?

Link

Q4: Why is React Router used?

To navigate between pages without reloading.
