Did You Know?

React was created by **Jordan Walke** at Facebook in 2013. It is used to build fast and interactive user interfaces.

Introduction to React

React is a JavaScript library used for building user interfaces. It allows developers to create reusable components for modern web applications.

What is React?

React is an open-source library developed by Meta (Facebook). It helps developers create single-page applications with fast and dynamic user experiences.

Features of React

- Component-Based Architecture
- Reusable Components
- Virtual DOM
- Fast Performance
- One-Way Data Flow

JSX (JavaScript XML)

JSX allows developers to write HTML-like code inside JavaScript. It makes React components easier to create and understand.

Example

```
function App(){  
  return (  
    Hello Noor  
  );  
}
```

React Components

Components are independent and reusable pieces of UI in React. There are two main types of components:

- Functional Components

- Class Components

Props & State

Props are used to pass data from one component to another. State is used to store and manage data that can change over time.

Example

```
const Welcome = (props) => {  
  return  
    {props.name}  
  ;  
}
```

☐ React Hooks

Hooks allow functional components to use React features like state and lifecycle methods.

- `useState()`
- `useEffect()`
- `useContext()`

React Router is used to create navigation between different pages in React applications.

Q1: What is React?

React is a JavaScript library used to create user interfaces.

Q2: What is JSX?

JSX is a syntax that allows writing HTML-like code in JavaScript.

Q3: What are components?

Components are reusable parts of a React application.

Q4: Difference between Props and State?

Props pass data to components, while State manages changing data.

Final Quick Revision

Created By: Jordan Walke

Created In: 2013

Library: JavaScript Library

Developed By: Meta (Facebook)

Main Concepts: JSX, Components, Props, State, Hooks
